

7 questions to ask when choosing a sanctions list provider

SWIFT's sanctions compliance services enable you to screen transactions and customer names, test and certify the effectiveness of your sanctions filters and download up-to-date public watch lists.

Where sanctions lists are concerned, financial institutions can either appoint a dedicated team of people to source and manage their lists – an approach which brings considerable overheads – or they can appoint a 'one-stop shop' vendor to deliver the complete file each day.

Choosing a sanctions list provider is an important task, as the institution will rely on the data provided to flag up target names while minimising false positives.

At the same time, switching between providers can be both costly and inconvenient. It is therefore important that financial institutions spend some time understanding the differences between the lists available, as well as the possible pitfalls, before coming to a decision.

When weighing up the available options, financial institutions should therefore take into account a number of different factors, from the benefits of enrichment to the hidden costs of poor or badly formatted data.

By asking the following questions, institutions will be better placed to choose the provider most suited to meet their needs.

Mike Powell, Senior Manager, Financial Crime Compliance, SWIFT

Mike joined SWIFT in 2014 from Lloyds Banking Group where he spent the previous 15 years working in Financial Crime, Global Transaction Compliance, with a primary focus on group AML and global sanctions screening operations. Since joining SWIFT, Mike has used his expertise to support development of SWIFT's Financial Crime Compliance portfolio. Mike has been instrumental in developing SWIFT's Sanctions List Distribution service, where he has consulted with SWIFT's user community and regulatory bodies that issue sanctions lists. Sanctions List Distribution provides standardised sanctions lists in any format for use by screening tools and is backed by a data model based upon the UN and OFAC standard lists. The use of such standardised lists can increase screening effectiveness and efficiency, reducing the number of false positives.

1

Why use a third-party provider?

Why should an institution use a third-party provider instead of simply sourcing data from the relevant regulators? Going directly to the regulatory sources might seem like the most obvious choice: after all, this is where the data originates. In practice, however, downloading lists from regulatory websites can be an unwieldy task which involves accessing information from multiple sources and in various different formats.

Even once it has been collated, data accessed directly from regulatory sources may be poorly structured or may not be in a useable format, making it necessary for banks to enter data manually. It is also worth noting that if banks access data directly from the regulatory source, they will not benefit from any support.

Third-party list providers, in contrast, put everything together in one place and in a single format, providing consistency and convenience, as well as offering support – all of which can provide advantages over using regulatory sources. They may also enrich list data with missing information such as BICs to support the screening process.

However, institutions should also be aware of some other considerations. For one thing, banks need assurance that the aggregator has picked up all of the relevant data and represented it in the same way as the individual source. Banks also need to ascertain that their chosen provider is a good fit for the bank's own risk appetite.

It is also worth noting that while putting everything together in one place can be seen as an advantage, it takes time for vendors to do this – particularly when the file is enriched. It is therefore not unusual for vendors to take over 24 hours to make a file available to an institution: a speed to market which some institutions may find problematic.

2

What are the hidden costs of poor list data?

Suboptimal list data can result in a number of hidden costs. Take false positives, for example. A significant number of false positives may result from vendors either adding additional (and sometimes unnecessary) entities and aliases, or failing to remove previously deleted entities. When source data is not well-structured, such as when all elements of a given name are grouped together rather than separated into individual parts, the number of false positives increases as well. The higher the number of false positives, the greater the number of staff required to handle them.

On the other hand, different vendors have different 'editorial policies': some may remove certain information to reduce the number of false positives. While this might reduce the workload for their customers, there is a risk that organisations using those lists will fail to catch certain names.

All too often, businesses focus on budget-related costs while overlooking the costs involved in time wastage. Where lists are concerned, financial institutions may simply assume that dealing with list data takes a certain amount of time. But if organisations can avoid time being wasted as a result of poor list data, they may be able to redeploy people's time more effectively, for example by training them as fraud investigators or AML investigators.

3

How do I know whether my list provider is selling me good quality data?

The only way to find this out is by running a full comparison of the vendor's list against the regulatory list. Some vendors provide point in time assurance reports to customers to demonstrate process quality.

That said, it is important to note that even regulatory lists, in an attempt to aid institutions in their screening, can contain incomplete or non-standardised data. For example, a target name as provided by the regulator may include additional 'metadata', such as country names. While this may help to eliminate false positives, there is also a risk that filters may miss a target name because they are (for example) looking for a combination of six words instead of three.

Some vendors address this issue by moving the location metadata into a different field, which can have the advantage of reducing false positives and thereby reducing the institution's costs and the headcount required for the task.

4

How can I compare different lists from different providers?

Institutions can compare and contrast different vendors' lists by running their files against a particular data set and analysing the results. This process requires skilled investigators to assess the difference in hits between the two lists, to assess the quality of the potential matches and determine whether or not the list is in accordance with the risk appetite of the institution.

SWIFT's Sanctions Testing tool can also assist with this process. While this exercise requires time and effort, it is the most effective way of discovering which list is most suitable for the organisation's requirements.

SWIFT's sanctions compliance services

SWIFT offers a number of utility services as part of its sanctions compliance portfolio

Sanctions Screening

This fully-managed, securely hosted service lets you screen incoming and outgoing transactions against all leading watch lists, Sanctions Ownership Research lists from Dow Jones, and your own private lists.

Name Screening

Hosted by SWIFT, Name Screening enables you to screen individual and entity names (and soon customer databases) as part of your ongoing compliance process.

Sanctions Testing

Enables financial institutions and corporates to test, improve and certify the effectiveness and efficiency of their transaction, customer and PEP filters.

Sanctions List Distribution

Up-to-date public watch lists with additional BIC enrichment for download in standard and advanced XML format.

5

What is the difference between enhanced and standardised list data?

A lot of list issuers provide an XML file with standardised data. Advanced XML files tend to have data which is categorised more effectively and which appears in more suitable field structures to aid screening. There is also a difference when it comes to file size: advanced XML files are bigger than standard XML files because advanced XML contains more fields.

While authorities such as OFAC and the United Nations as well as some leading data vendors provide advanced XML list files, filter vendors have been slower to leverage these more granular data sets to deliver enhanced screening effectiveness and efficiency. However, if the bank's filter is capable of taking the advanced XML file, this is likely to be the preferable option.

6

How can I make sure my lists are fit for purpose?

'Fit for purpose' can encompass a number of different elements, such as the degree of enrichment to a file accepted – or required – by the institution. It is not unknown for vendors to include many variations of a name spelling, over and above those provided by the regulatory list issuer. This can, in turn, generate a large number of false positive hits compared to the standard list.

In order to ascertain whether lists are fit for purpose, institutions should have a policy which includes a risk appetite statement setting out the organisation's requirements for sanctions screening. This statement, as applied to list vendors, may include such considerations as which enrichments the vendor provides, the number of fields the data is broken down into, the scope of lists the vendor is able to provide, and the vendor's proposed list update schedule, to name a few. Ultimately, institutions should conduct tests and analyse the results to see whether the expected alerts are generated.

7

What is the benefit of enrichment?

Enrichment is something that vendors do in order to make files more useable and more detectable for names. As such, it is often used as a point of differentiation by list providers. Enrichment can come in different forms: it might involve taking elements of a standard file and putting them into the vendor's own data model in order to improve screening. Enrichment may also mean adding elements to the file to aid the detection of sanctioned identities, such as a bank BIC.

It is also worth noting that a single vendor may offer a number of different products, so it is important to choose the product which is the best fit for the relevant business problem. The risk is that banks may buy a product which has irrelevant data which increases operational cost without adding any value. It is also worth noting that some types of enrichment may result in significantly more hits, so may not necessarily benefit the organisation. Again, the easiest way of finding out whether or not enrichments are beneficial is to test the relevant data set against different providers' lists.

Conclusion

Third-party list providers can offer considerable advantages over sourcing lists directly from regulators. That said, it is important to be aware of the variety of different products and approaches taken by different providers.

Institutions should take the time to understand the types of list available – and the pros and cons of each – in order to obtain data which is fit for purpose and which maximises the effectiveness and efficiency of the institution's sanctions screening activities.

Finally, institutions will want to choose a vendor that works closely with its customers to ensure that its products keep abreast of changing regulatory requirements, and that is committed to providing flexible list data sets adapted to each customer's specific risk appetite and system capabilities.

SWIFT's utility model delivers

Scalability to address the needs of customers of different sizes, in different locations, with different compliance requirements.

Integration of third-party services such as PEP and research-based 'sectoral sanctions' lists.

Secure SWIFT hosting for rapid implementation, cost transparency and data security.

The combination of – and interaction between – different services in the portfolio.

About SWIFT

For more than 40 years, SWIFT has helped the industry address many of its biggest challenges. As a global member-owned cooperative and the world's leading provider of secure financial messaging services, we enable more than 11,000 banking and securities organisations, market infrastructures and corporate customers in more than 200 countries and territories to communicate securely and exchange standardised financial messages in a reliable way.

As their trusted provider, we facilitate global and local financial flows, relentlessly pursue operational excellence, and continually seek ways to lower costs, reduce risks and eliminate operational inefficiencies. We also bring the financial community together to work collaboratively to shape market practice, define standards and debate issues of mutual interest.

SWIFT users face unprecedented pressure to comply with regulatory obligations, particularly in relation to the detection and prevention of financial crime. In response, we have developed community-based solutions that address effectiveness and efficiency and reduce the effort and cost of compliance activities. Our Compliance Services unit manages a growing portfolio of financial crime compliance services in the areas of Sanctions, KYC and CTF/AML.

SWIFT's Customer Security Programme, which launched in June 2016, is a dedicated initiative designed to reinforce and evolve the security of global banking, consolidating and building upon existing SWIFT and industry efforts. The programme will clearly define an operational and security baseline that customers must meet to protect the processing and handling of their SWIFT transactions.

SWIFT will also continue to enhance its own products and services to provide customers with additional protection and detection mechanisms, and in turn help customers to meet these baselines.
